Eisenhower Matrix: ff (ESPN Fantasy Football CLI in Bash)

Manan Chaudhary

	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** • ESPN fetch wrapper: one curl function that pulls league data using the league ID and espn_s2/SWID cookies stored in a git-ignored config file • ff roster: show my players with readable positions, teams, and starter/bench status (translating ESPN's numeric ID codes) • ff week N: show my weekly matchup with points scored per player • Bench report: points left on the bench each week • Waiver report: free agents scoring above their projections • CSV export of roster and scoring data so users can run their own analysis	**Schedule - (For V2.0+)** • Response caching to cut down on repeated API calls • ff standings: win-loss record and points for/against • ff trends: ASCII charts of player points across the season • Custom scoring "what-if" rules (e.g. standings under PPR) • Automated tests with bats-core using saved JSON fixtures
Not Important	**Delegate - (Use a library)** • JSON parsing: use jq instead of writing a parser • Code quality checks: use ShellCheck • Charts and deeper analysis: export to CSV and use Google Sheets • Authentication: copy cookies from the browser instead of building a login flow	**Delete - (Cut it)** • Automatically setting lineups or submitting waiver claims • Machine-learning player projections or a trade predictor • Web dashboard or GUI • Support for Yahoo and Sleeper leagues • Live in-game push notifications
